### **Submitted Questions and Responses**

1. Does "Active mechanical extraction of free phase product and ...groundwater..." not necessarily mean extraction via dedicated pumps and treatment equipment?

**The bid specifications say at a minimum this could be routine extraction from sumps in the excavation, so that means dedicated pumps and treatment equipment are not a necessary condition for bid specification compliance.**

2. Do all wells (e.g. MW-1, MW-8) removed during the course of excavation have to be replaced? **Yes, unless an extraction well or extraction sump would occupy the location of the former monitoring well.**

3. Do all contaminated (above ES) wells have to be included in a monitoring program? Do uncontaminated wells have to be included? Will bids that include only semi-annual monitoring in the second year be accepted? **This is covered in the bid specifications, no additional clarification is needed.**

4. The reports do not seem to mention potable wells: is it assumed that there are none nearby that require sampling? **There are no potable wells to be sampled.**

5. Will the DNR require demonstration of a decreasing contaminant trend in all wells as a condition of closure? **The question presumes information not yet stated by the bidder, i.e. the type of closure the bidder has selected, thus a response is not possible.**
